AGENTFORGE / PERSONAL EXPLAINER

One safe path from chart to briefing

The server owns scope, evidence, and verification.

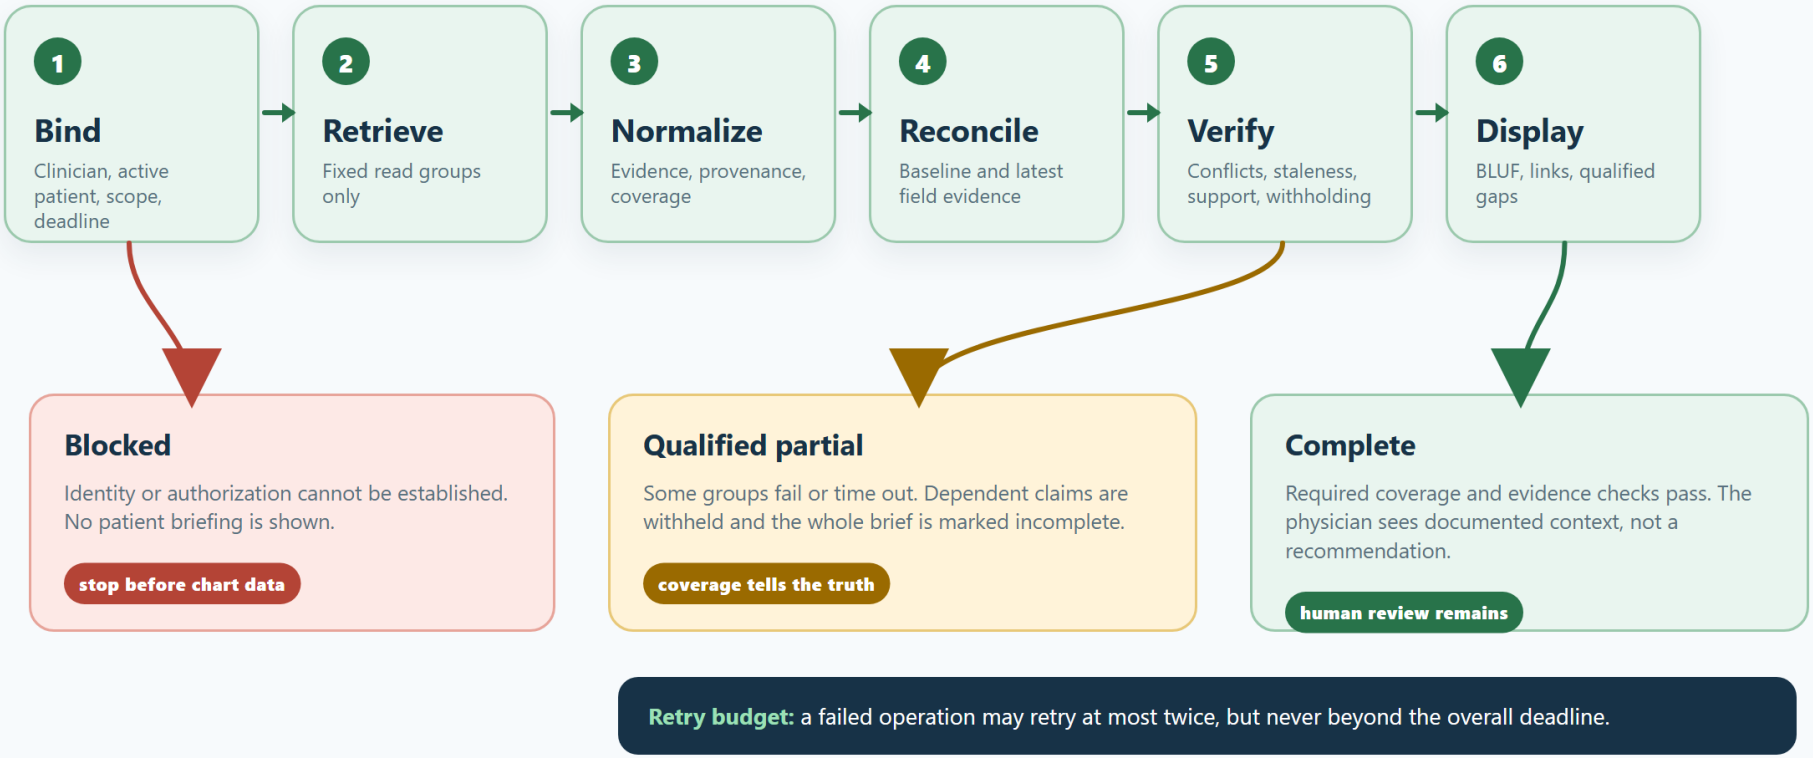

Hard boundary: AgentForge can summarize documented evidence and plans, but it cannot write to the chart or recommend a new clinical action.

System boundary: OpenEMR context -> AgentForge server policy -> verified physician briefing and local trace.

AGENTFORGE / PERSONAL EXPLAINER

Every request has a safe stopping point

Authorization gates the start. Verification gates the display.

Run lifecycle: bind -> retrieve -> normalize -> reconcile -> verify -> display, with blocked and qualified exits.
